1)

$$\text{HC}_7\text{H}_3\text{O}_2(\text{aq}) \rightleftharpoons \text{H}^+(\text{aq}) + \text{C}_7\text{H}_3\text{O}_2^-(\text{aq})$$

initial	0.35 M	0 M	0 M
change	- x M	+ x M	+x M
equilibrium	(0.35 - x) M	x M	x M

Note that:  $(0.35 - x) \text{ M} \approx 0.35 \text{ M}$  so

$$K_a = \frac{[\text{H}^+][\text{C}_7\text{H}_3\text{O}_2^-]}{[\text{HC}_7\text{H}_3\text{O}_2]} = \frac{(x)(x)}{(0.35 - x)} = \frac{(x)(x)}{(0.35)} = \frac{x^2}{(0.35)} = 6.3 \times 10^{-5}$$

$$x^2 = (6.3 \times 10^{-5})(0.35) = 2.205 \times 10^{-5}$$

$$x = 4.7 \times 10^{-3} \text{ M} \quad x = \text{moles/L formed}$$

$$\text{pH} = -\log(4.7 \times 10^{-3}) = 2.33$$

2)

$$\text{HClO}(\text{aq}) \rightleftharpoons \text{H}^+(\text{aq}) + \text{ClO}^-(\text{aq})$$

initial	0.275 M	0 M	0 M
change	- x M	+ x M	+x M
equilibrium	(0.275 - x) M	x M	x M

Note that:  $(0.275 - x) \text{ M} \approx 0.275 \text{ M}$  so

$$K_a = \frac{[\text{H}^+][\text{ClO}^-]}{[\text{HClO}]} = \frac{(x)(x)}{(0.275 - x)} = \frac{(x)(x)}{(0.275)} = \frac{x^2}{(0.275)} = 3.0 \times 10^{-8}$$

$$x^2 = (3.0 \times 10^{-8})(0.275) = 8.25 \times 10^{-9}$$

$$x = 9.08 \times 10^{-5} \text{ M}$$

$$\text{pH} = -\log(9.08 \times 10^{-5}) = 4.042$$

3)

First the amount of  $\text{H}^+$  from each acid must be calculated.

$$\text{HNO}_2(\text{aq}) \rightleftharpoons \text{H}^+(\text{aq}) + \text{NO}_2^-(\text{aq})$$

initial	0.0925 M	0 M	0 M
change	- x M	+ x M	+x M
equilibrium	(0.0925 - x) M	x M	x M

Note that:  $(0.0925 - x) \text{ M} \approx 0.0925 \text{ M}$  so

$$K_a = \frac{[\text{H}^+][\text{NO}_2^-]}{[\text{HNO}_2]} = \frac{(x)(x)}{(0.0925 - x)} = \frac{(x)(x)}{(0.0925)} = \frac{x^2}{(0.0925)} = 4.5 \times 10^{-4}$$

$$x^2 = (4.5 \times 10^{-4})(0.0925) = 4.1625 \times 10^{-5}$$

$$x = 6.45 \times 10^{-3} \text{ M} \quad x = \text{moles/L formed}$$

$$\text{HC}_2\text{H}_3\text{O}_2(\text{aq}) \rightleftharpoons \text{H}^+(\text{aq}) + \text{C}_2\text{H}_3\text{O}_2^-(\text{aq})$$

initial	0.139 M	0 M	0 M
change	- x M	+ x M	+x M
equilibrium	(0.139 - x) M	x M	x M

Note that:  $(0.139 - x) \text{ M} \approx 0.139 \text{ M}$  so

$$K_a = \frac{[\text{H}^+][\text{C}_2\text{H}_3\text{O}_2^-]}{[\text{HC}_2\text{H}_3\text{O}_2]} = \frac{(x)(x)}{(0.139 - x)} = \frac{(x)(x)}{(0.139)} = \frac{x^2}{(0.139)} = 1.8 \times 10^{-5}$$

$$x^2 = (1.8 \times 10^{-5})(0.139) = 2.502 \times 10^{-6}$$

$$x = 1.58 \times 10^{-3} \text{ M}$$

Then add the results together and use that value to find the pH.

$$6.45 \times 10^{-3} \text{ M} + 1.58 \times 10^{-3} \text{ M} = 8.03 \times 10^{-3} \text{ M}$$

$$\text{pH} = -\log(8.03 \times 10^{-3}) = 2.095$$
